

Selling And Buying App

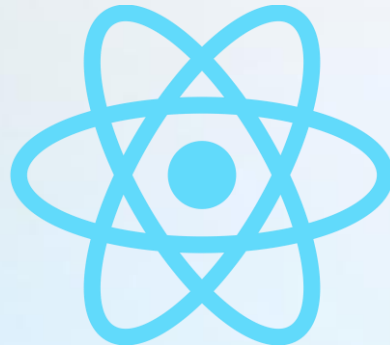

React Native Application

Pellizzaro Federico

Idea behind

- App to sell and buy items from **single customers**, not companies
- Payment based on **customers choice**
- Posts are listed globally but can be **filtered, liked** and **created**
- Users interactions extended with **outer Applications**

Technologies used

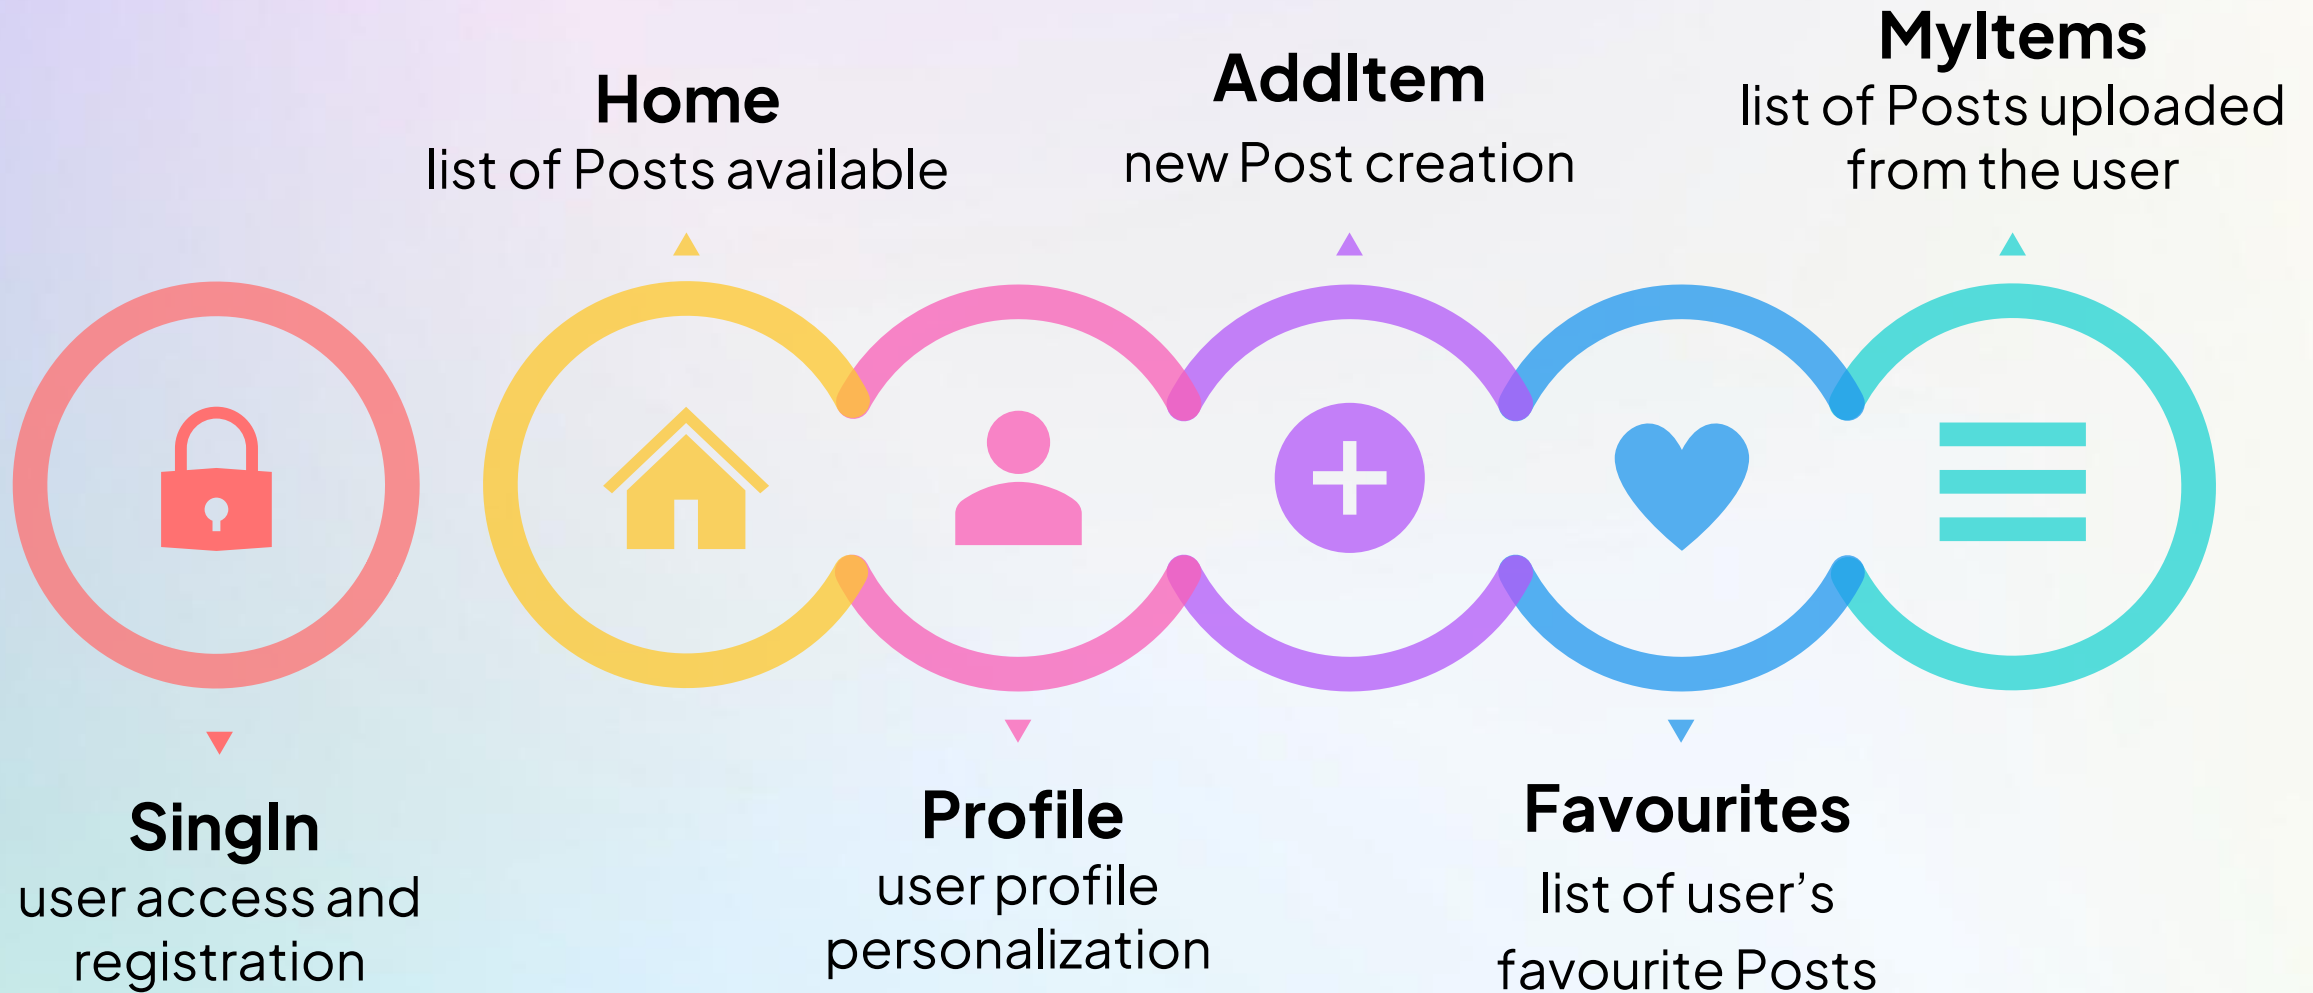

Features Implemented

- **Login** with accounts to differentiate users
- User profile **personalization**
- Ability to create **new Posts**
- Images selection from **Personal folder** or using **Camera**
- Favourite system using **likes**
- Ability to **manage** user's posts and favourites posts

Post

Screens

Challenges

- Clever way to store posts inside **AsyncStorage**
- **Reanimated Carousel** vs **FlatList** for images slider
- Hard to use some components due to **limited documentation** (like newest components)
- React Native uses a **limited, non-cascading** version of CSS in JS

Future Improvements

- Map implementation using **Google maps API** or **Mapbox** for city selection
- Ability to **modify** an existing Post
- Password **cryptography**
- Improve **application styling**
- Add **in-pay** functionality
